

Project Design Phase

Problem – Solution Fit Template

Date	3 October 2026
Team ID:	SWTID-2026-5797
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. It helps entrepreneurs, marketers and corporate innovators identify behavioral patterns and recognize what would work and why

Purpose:

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behavior.
- Sharpen your communication and marketing strategy with the right triggers and messaging.
- Increase touch-points with your company by finding the right problem-behavior fit and building trust by solving frequent annoyances, or urgent or costly problems.
- **Understand the existing situation in order to improve it for your target group.**

Template: The filled Problem-Solution Fit canvas for this project is on the next page.

Problem – Solution Fit Canvas: Auto Ticket Classification using Flow Designer (Team 16)

1. CUSTOMER SEGMENT(S) Who is your customer? - Students and teachers of the school who raise IT support requests (Wi-Fi, projector, password and slow computer issues). - School IT helpdesk staff who review and route the tickets.	6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit their choices of solutions? - Small IT team and a growing number of daily requests. - Limited school budget, so paid or AI-based ITSM add-ons are not an option. - Students are not technical and may not know the correct category or subcategory. - Solution must be no-code and easy for school staff to maintain. - Depends on working school network and email.	5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem? What pros and cons do they have? - Telling IT staff in person or by phone; writing in a complaint register. - Sending an email or WhatsApp message to IT staff. - Manual ticket review where an agent reads each ticket and picks the category. - Pros: simple and familiar. Cons: slow, inconsistent categories, human errors, hard to track, not scalable.
2. JOBS-TO-BE-DONE / PROBLEMS Which jobs-to-be-done (or problems) do you address for your customers? - Get an IT issue reported quickly and fixed without delay. - Know that the request was received. - IT staff need every ticket classified correctly (Category and Subcategory) without reading and sorting each one by hand. - Reduce manual effort and improve ticket routing.	9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? - Ticket volume grows every day but classification is done manually by IT staff. - Tickets are written as free text, so the issue type must be identified by reading each one. - No rules or automation exist to map keywords in the description to a category. - Callers do not know which category to choose.	7. BEHAVIOUR What does your customer do to address the problem and get the job done? - Students and teachers submit a ticket with their name and a short description of the issue. - Urgent issues (for example a projector failing before class) are reported directly to the IT room. - They ask again for the status when no reply comes. - IT agents read each ticket, choose category and subcategory, and inform the caller manually.
3. TRIGGERS What triggers customers to act? - Wi-Fi not working in the library or labs. - Projector not turning on before a class. - Forgotten password or login problem before an exam or submission. - Computer running slow or hanging during work.	10. YOUR SOLUTION Current solution of the project, checked against customer limits and behaviour. - A ServiceNow Flow Designer flow, Auto Classify School IT Tickets, on the custom table Incident WorkFlow. - The flow runs when a ticket is created with an empty Category and checks keywords in the Short Description. - Wi-Fi / Network sets Network - Wi-Fi; Projector sets Hardware - Projector; Forgot Password sets Access - Forgot Password; Slow Computer sets Performance - Slow Computer. - Dependent choice fields keep Category and Subcategory consistent. - A Send Email action then confirms ticket creation to the caller. - Completely no-code, low cost, easy to maintain and scalable.	8. CHANNELS of BEHAVIOUR 8.1 ONLINE What kind of actions do customers take online? - Create a ticket in ServiceNow by entering the Caller and Short Description. - Receive the automatic confirmation email: Your Request for the issue has been submitted. - Check email for updates on the request.
4. EMOTIONS: BEFORE / AFTER How do customers feel when they face a problem or a job and afterwards? - Before: frustrated, stressed, unsure whether the request reached IT. - After: relieved, confident and in control, because the ticket is classified and a confirmation email arrives right away.		8.2 OFFLINE What kind of actions do customers take offline? - Visit or call the IT room for urgent problems. - Teachers tell lab staff or the IT team verbally. - Written note or complaint register entry.
