

Project Design Phase Proposed Solution Template

Date	3 October 2026
Team ID:	SWTID-2026-5797
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The school IT helpdesk receives many incident requests every day from students and teachers, such as Wi-Fi issues, projector failures, password problems and slow computers. IT staff currently review each request by hand and assign the category and subcategory. This is time-consuming, error-prone and not scalable as the number of requests grows.
2.	Idea / Solution description	An automated ticket classification system built with ServiceNow Flow Designer on a custom table, Incident WorkFlow. • The student only enters the Caller and a Short Description. • When the ticket is created with an empty Category, the flow checks the Short Description for keywords (Wi-Fi / Network, Projector, Forgot Password, Slow Computer). • It then sets the matching Category and Subcategory automatically. • A confirmation email is sent to the caller right after the ticket is created.
3.	Novelty / Uniqueness	• Completely no-code: built only with Flow Designer, with no scripting or machine learning. • Classification happens at the moment of ticket creation, with no manual step. • Dependent choice logic keeps Category and Subcategory consistent. • Structured custom table with auto-numbered tickets (INC prefix) and an automatic email acknowledgement. • Easy for school staff to understand and maintain.
4.	Social Impact / Customer Satisfaction	• Students and teachers get faster support, so less class and study time is lost to IT problems. • Instant confirmation email gives users confidence that their request was received. • Consistent classification removes human error and helps tickets reach the right place sooner. • IT staff spend less time sorting tickets and more time fixing real problems.

S.No.	Parameter	Description
5.	Business Model (Revenue Model)	• Runs on the school's existing ServiceNow platform, so there is no extra licence or tool cost; the value comes from saved staff time and quicker resolution. • The solution is packaged as an update set (XML file), so it can be reused by other schools and institutions. • Possible future revenue: setup and support service for other educational institutions.
6.	Scalability of the Solution	• New keywords and conditions can be added to the flow without any code. • New categories and subcategories can be added through the choice lists and dependent values. • The update set can be exported and installed on other ServiceNow instances. • Can be extended with assignment automation, SLA tracking or predictive intelligence. • Suitable for small to medium environments such as schools and colleges.
