PROJECT JOURNEY MAP

Auto Ticket Classification Using Flow Designer

SCENARIO

Reporting, automatically classifying, tracking, and resolving a school IT incident.

	Entice	Enter	Engage	Exit	Extend
	How does someone initially become aware of this process?	What do people experience as they begin the process?	In the core moments in the process, what happens?	What do people typically experience as the process finishes?	What happens after the experience is over?
Steps What does the person (or group) typically experience?	Notices an IT problem	Opens the incident form	Enters name and issue	Submits the incident	Flow Designer classifies it	Receives confirmation email	Support staff handles ticket	Incident is resolved and closed
Interactions What interactions do they have at each step along the way? People: Who do they see or talk to? Places: Where are they? Things: What digital touchpoints or physical objects would they use?	Sees a Wi-Fi, projector, password, or slow-PC issue.	Uses the school IT helpdesk incident form.	Interacts with the form using a browser and keyboard.	Clicks Submit; incident data is sent to the workflow.	Flow Designer checks issue keywords and assigns category/subcategory.	Receives an automated status/confirmation email.	Support staff reviews the stored incident record.	Requester receives the resolution and can confirm the issue is closed.
Goals & motivations At each step, what is the person's primary goal or motivation?	Help me report my issue quickly.	Help me provide the right details.	Help me submit without confusion.	Help me know my request was received.	Help me get the ticket routed correctly.	Help me feel confident the ticket is being handled.	Help me get the problem solved.	Help me finish the request without repeated follow-up.
Positive moments What steps do they find enjoyable, productive, motivating, delightful, or exciting?	Clear problem is recognized.	Simple form is easy to access.	Relevant details are entered in one place.	Immediate submission reduces manual effort.	Automatic classification is fast and consistent.	Confirmation provides reassurance.	Support staff receives a structured ticket.	Issue is resolved and the requester gets closure.
Negative moments What steps do they find frustrating, confusing, costly, or time-consuming?	Issue interrupts teaching or study.	Finding the correct help channel may take time.	Missing details can cause confusion.	Uncertainty about what happens next.	Incorrect keywords may affect classification.	No email would leave the requester unsure.	Manual re-checking can slow resolution.	Repeated follow-up is frustrating if status is unclear.
Areas of opportunity How might we make each step better? What ideas do we have?	Provide a visible helpdesk entry point.	Keep the incident form simple and guided.	Use clear labels and required fields.	Show a submission confirmation immediately.	Maintain keyword rules for Network, Hardware, Access, and Performance.	Send automatic confirmation/status email.	Store category and subcategory for easy routing.	Add clear closure/status information for the requester.
